

LiveCap 01

What this thing does:

It is a system for live captioning.

What you need:

A dual monitor setup.

How to operate:

Run the application and type a bit of text in the textbox on the left top.

The second monitor should display/update your text when you hit Space.

Then, press 'Setup'. You'll be taken to the Setup page. Now you can drag the text on the second monitor to a position of your liking, and alter the feel and look by selecting a font, and set outline / shadow / box options.

You can also now drag the text entry field to a size that makes auto-wrapping good for the fontsize you've chosen for the second monitor.

In the normal mode, when you type and hit a space or colon, semi-colon, question mark, exclamation mark the second monitor will update.

The second monitor will always be bottom aligned, and will have a two line maximum.

If you want to save your work:

Press 'Start'. Titles will then be saved in the scrollbox left down, and in an SRT file next to the application.

ToDo:

Add external TC.

Add Macro functions.

Add a scratchpad?
